

Relation Algebra

§2. Relations

(2a)

$\mathbf{Rel}$ is a poset-enriched category with $(\otimes, \circ)$ where $\otimes$ is commutative cartesian product, and converse $\circ \dashv \circ$, and

$\mathbf{C}: (\triangleright : A \otimes A \rightarrow A, \circ \dashv : I \rightarrow A)$ a commutative monoid with $\mathbf{C} \circ \dashv \mathbf{C}$. We write $\mathbf{C} \circ$ as $(\triangleleft : A \rightarrow A \otimes A, \circ \dashv : A \rightarrow I)$

(2b)

$\triangleright$ associative

$\triangleright$ commutative

$\circ \dashv$ is its unit

Frobenius, one half — the other is its $\circ$

$R \triangleleft \leq \triangleleft (R \otimes R)$

$R \circ \leq \circ$

§2.1. $\forall$ object A , $(A, \triangleleft, \circ \dashv) \dashv (A, \triangleright, \circ)$

(2.1a)

$\triangleright \triangleleft \leq 1$

$1 \leq \triangleleft \triangleright$

$\circ \dashv \circ \leq 1$

$1 \leq \circ \dashv \circ$

The last of these is the only one that makes a picture **bigger**, and it is worth a name: **a wire is below the cut wire**. In $\mathbf{Rel}$ it reads $\{(a, a)\} \subseteq A \times A$ — cut a wire and its two ends stop having to agree, so cutting can only add pairs. It is the one weakening this calculus gives away for free.
